

Mastermind App - Project Details

Om Namah Shivay - Jai Shri Shanidev Maharaj

App Name: Mastermind App

Main Feature: An app to solve the problem of forgetting things by gathering all information, writing it down, and processing it.

1. Core Technology

- It will be built by combining AI and Computer technology so that there are no flaws.
- The app must run on a fully automatic system.

2. Security Features

- The security should be top-notch so no one else can open it. Only the account owner should be able to open it, and it shouldn't be hackable even from a computer.
- There will be 4 lock systems:
 1. Pattern Lock
 2. Number Lock
 3. Fingerprint Lock
 4. Voice Lock - It should only open with the owner's exact voice.
- **Emergency Access:** The user will have the option to set 2 passwords. One for normal use, and a second one for their family in case of any future mishap/emergency. The app will show a warning message asking the user to write this second password in a diary somewhere safe.
- (Point 3) Security should have 3 levels/categories so no system can hack it.
- (Point 4) Official Email ID: MASTERMIND1259@gmail.com
- (Point 5) The app must be linked to the customer's mobile number.

3. Notifications & Reminders

- (Point 6) It should ring on the phone and speak out notifications. For example, if we saved a task, it should speak and say: "Hello sir, please check your plan."
- (Point 7) Mail ID and passwords will be generated.

4. Language Support

- (Point 8) It should work in every Indian language. Whatever language the customer selects, including all regional languages.

5. Automatic Voice Chat & Typing

- (Point 9) The app will have an automatic chat. The user just speaks in their language, and the app will type it out in the same language. It will also follow voice commands like "lock this" or "save this/store this" automatically.
- (Point 12) If a person only wants to write by speaking, the voice system should be the primary option so they don't have to type by hand. However, a manual typing option should also be available just in case.
- (Point 11) Whatever the person speaks, it should clearly type it out in their selected language. The user can choose to save it or delete it just by speaking.
- (Point 16) Voice recognition should be very clear, whether the user speaks in English, Hindi, or any other language. (Unlike YouTube where the voice sometimes isn't clear, this must be crystal clear).
- (Point 21) The entire process should be automatic but very clear—whether it is voice, video, or screen display.

6. Smart Scheduling & Reminders

- (Point 10) For daily things, plans, or items needed, the user can speak: "Remind me in 1 minute, 1 hour, 1 day, or at a specific time (AM/PM) and date." At that exact time, the phone will ring and the app will say, "Hello sir, check your plan."
- **Snooze/Reschedule:** The user can reply by speaking, "Not right now, tell me after 10 minutes," and it will remind them in 10 minutes. If they say "Remind me in 1 hour," it will update the time. This should work via both voice and video.
- (Point 14) Example: If someone says, "Remind me after 1 hour or at 12:01 AM/PM to buy a diary, 10 kg potatoes, vegetables, onions," the app will write it in a chart. Later it will say, "Hello sir, check your plan." If the user says, "I am busy right now, tell me after 2 hours," it will automatically remind them after 2 hours. This snooze loop can continue until the user finishes the task or deletes it.
- (Point 15) If a user tells it 10 different tasks (e.g., Task 1 in 5 hours, Task 2 in 1 hour, 3 tasks in 2 hours), it should announce all of them exactly at their set times. Even if a reminder is for 1 year later, it should speak out on that exact day and time.

7. Secret Box

- (Point 13) There will be a 'Secret Box' inside the app with a separate password. Only the app owner can open and see it (not even family members). Here, the user can speak and save their life secrets, stories, sorrows, or happiness. It will be completely safe. Memory/Data storage for this needs to be large.

8. Tech & Business Questions

- (Point 17) What technology is being used and how much time will it take?
- (Point 18) What will be the cost?
- (Point 19) How will the app be promoted? How can we get fast publicity among the public?
- (Point 20) All server work and other tasks should use the provided Email ID.
- (Point 22) The app should work on any company's smartphone (Maybe build it as a Hybrid app or whatever is best).
- (Point 23) How will the editing etc. work?

9. Quick Access (Voice Open)

- (Point 24) Just like unlocking a phone with a fingerprint, if the user says "Mastermind App", it should open instantly. The chat should open immediately so the person can start speaking, and the app should start catching the words and typing right away, no matter how fast or how much they speak.
- (Point 27) The app should open immediately on a voice command. If the customer wants to close/remove it quickly, it should also close via voice command.

10. Future & Growth

- (Point 25) How should we promote it so it grows fast and reaches the maximum number of people?
- (Point 26) Terms & Conditions: The company (us) will have full rights to make any changes or add new rules to the app. Users will have to tick a checkbox agreeing to this (Company protected).
- (Point 28) If there is any next-level technology available, it should also be added so we don't face problems in the future.
- (Point 29) Feedback: There should be a feedback function for the public. If we need to make changes based on public demand in the future, we can do it. This feedback system should also work via voice.
- (Point 30) Future options must be included.
- (Point 31) If there are any other related technologies or future features that fit this app, they should also be added.
